

ADAPTIVE RAILWAY EMERGENCY MANAGEMENT SYSTEM

ASE-PROJECT

ABSTRACT

The Adaptive Railway Emergency Management System is designed to improve the speed and effectiveness of railway emergency response. The system allows passengers and railway staff to report emergencies such as fire, medical issues, accidents, overcrowding, or suspicious activities through a web or mobile application. Based on the emergency type, severity, and location, the system assigns priority and sends targeted notifications to railway authorities, emergency teams, and affected passengers. A centralized dashboard enables authorities to monitor, assign, and track emergencies in real time. The system aims to reduce response time, improve communication, and enhance passenger safety through adaptive emergency management.
